

X-Vault

What it is

X-Vault is a Chrome extension that passively captures tweets on Twitter/X as you browse. It stores them locally for search and export to LLMs.

Who it is for

People who want a local, searchable archive of tweets for analysis or LLM prompting while browsing Twitter/X.

What it does

- Automatically captures tweets on profile pages and individual tweet pages.
- Optionally captures home feed tweets with minimum likes and impressions thresholds.
- Stores tweets locally with per-user counts, notes, and starred users.
- Provides a dashboard with recent tweets, user list, and search across users.
- Sorts a user's tweets by date, likes, or views and supports selection/copy.
- Exports and imports full database backups and copies LLM prompts to clipboard.

How it works

- Content script runs on x.com/twitter.com, scans tweet DOM elements, and extracts text/metrics.
- Tweet data is sent to the background service worker via runtime messages.
- Background uses IndexedDB (tweets, users, settings, blockedUsers, searchIndex) and updates badge counts.
- Dashboard extension page requests data from background and renders UI; export/import uses JSON downloads.

How to run

- Clone the repo.
- Open chrome://extensions, enable Developer mode, and click Load unpacked.
- Select the repo folder to install the extension.
- Browse x.com or twitter.com and click the extension icon to open the dashboard.
